

From the WhiteCoat Innovation Team

Less to remember. More room to care.

HEALTHCARE · LONG-TERM SELF-CARE

Tencent Cloud AI CAN DO IT Hackathon Singapore 2026

Alex Lew · Shao Quan Chew · Yau Boon Tan

THE WORLD AROUND US

AI everywhere. Life at full speed.

More messages. More screens.
More competing for our attention.

THE CARE GAP

Care can slip through a busy day.

Our routines. Our health.
The people we mean to check on.

INTRODUCING

Your everyday health buddy.

A little more attention to your health.
A little more care for the people you love.

HEALTHCARE · LONG-TERM SELF-CARE

A DELIBERATE FOCUS

Care has its own space.

Designed around everyday health
and the people you care for.

01 Daily routines & medication

02 Dental & screening reminders

03 Sleep & health information

04 Health chat & your care circle

THE PROTOTYPE, UP CLOSE

Start with your care.

For yourself.

For someone you care for.

Choose a routine.

Make room for a small first step.

YOUR CARE CIRCLE

Your people. In view.

Keep a loved one's routines
and appointments close.

A personal care space,
with permission-aware access
as the intended model.

Your day. A little lighter.

One place to see the next care task
and keep everyday routines in view.

Routines
Rest
Readings

SLEEP

Make room for a better night.

Review rest.
Choose a wind-down routine.

Illustrative sleep data.
Wearable connection is planned.

HEALTH INFORMATION

Your health, at a glance.

Rest, routines and recorded readings.
A place to notice what deserves attention.

BENEFITS

Keep the details close.

Bring important plan notes
into your care space.
Confirm cover with the insurer.

Less searching.
More clarity.

A small nudge. A clear next step.

See what's due.

Mark it taken, skipped or later.

Follow existing medication instructions.

Responses are self-reported.

CARE, WHERE YOU ALREADY ARE

A reminder beyond the care app.

“Remind me to drink water
while I’m working.”

CareBuddy plugin concept

Codex experience planned

Current prototype: manual WorkBuddy handoff.
Export context, import a proposal, review before saving.

Talk through the next step.

Routines and appointment
preparation today.

WhiteCoat teleconsult connection
is a next step.

KEEPING CARE IN VIEW

Notice. Remember. Follow through.

Make the next care step easier
to see, discuss and remember.

Built around Tencent.

USER DEVICE

CareBuddy

Care circle · Routines · Health views

TENCENT CLOUD · INTENDED APPLICATION BOUNDARY

CareBuddy services

Identity, care records
and action validation

Tencent TokenHub

Model inference
for Buddy

Built with CodeBuddy

Development workflow

Review before execution

AI proposals pass application checks

External care providers

Separate boundary; explicit handoff

Early architecture view. The submission architecture appendix provides the 9 October 2026 implementation details.

TRUST BY DESIGN

Care needs clear boundaries.

Permissioned care

Family visibility should follow explicit access choices.

Visible actions

Let people review consequential proposals before saving or sharing.

Clinical limits

Support routines and preparation. Refer clinical decisions to qualified care.

THE TRADE-OFF

Less silent
automation.
More human control.

WHAT COMES NEXT

More ways to care.

01 Benefits, connected

Insurance information and clearer benefit guidance

02 A more useful day

Relevant news, weather and timely routines

03 Care within reach

Doctor discovery and WhiteCoat teleconsult access

04 CareBuddy, alongside you

A plugin experience, including hydration prompts in Codex

Meet the founders

The hands-on team behind CareBuddy

Alex Lew

Product and AI

AI in everyday use

Explores AI deeply and turns emerging models into tools he uses every day.

Built multilayer agents on VPS infrastructure, controlled through Telegram and SMS.

Brings product judgement to model choice and agent orchestration.

Shao Quan Chew

Architecture and security

A personal reason to build

Builds and manages the infrastructure behind CareBuddy.

Owens architecture and security, with a focus on dependable operations.

A cancer survivor who knows the burden of daily care and believes deeply in the product.

Yau Boon Tan

Technology and delivery

Full demo in under a day

Built the whole CareBuddy demo in less than a day.

Leads a technology team of more than 20 people in his day job.

Brings broad coding fluency and a deep understanding of the systems he builds.

Less to remember.
More room to care.

carebuddy.life ↗

Annex contents

Supporting slides for partner discussions and due diligence

A	Pilot & demonstration Demo scope, care journey, video, personal accounts and success measures	Slides 22–28
B	Market & commercial strategy Singapore market, differentiation, SWOT, unit economics and go-to-market	Slides 29–33
C	Partnerships & execution Tencent, NTU, WhiteCoat, joint pilot and the next 90 days	Slides 34–38
D	Architecture, security & privacy Demo architecture, production resilience, tenant isolation and data protection	Slides 39–47
E	Build evidence & resources CodeBuddy evidence and product, demo and platform references	Slides 48–51

What the demo shows today.

Visible in the prototype

Onboarding and care profiles
Daily routines and medication actions
Illustrative sleep and health readings
Benefits and saved Buddy actions
GP planning and WhiteCoat redirect
Scoped Codex / Claude assistant export

Still ahead

Verified sign-up and authentication
Connected wearable measurements
Live insurance eligibility checks
Durable hosted notification scheduling
Consent-verified family sharing
WhiteCoat teleconsult booking

Screens are captured from carebuddy.life. Fictional records and illustrative flows are used throughout the demo.

One family’s care journey

An illustrative day for an adult child helping Dad manage his care plan

01	02	03	04
Morning	Midday	Evening	When advice is needed
Today’s care plan	A reminder in Claude	A shared care view	A route to WhiteCoat
Dad follows his medicine plan. CareBuddy shows what is due. Clinical instructions stay fixed.	Host scheduling enables Claude to remind the family member about an exercise routine.	The family reviews care actions in Dad’s selected care circle. Access follows the selected role.	CareBuddy opens WhiteCoat. A doctor assesses suitability. Booking integration needs partner agreement.

Family follow-through

After a consultation, the family can organise agreed follow-up steps while preserving the doctor’s clinical instructions.

CareBuddy demo video

Mobile walkthrough, 5 min 58 sec

Healthcare Track · Case Study 2

01 / 09

Care Buddy

Healthcare Track · Case study 2

Care Buddy is our submission for the Tencent Cloud Healthcare Track, case study two: AI Healthier Every Day.

Actual website captures · Fictional care records

00:00 / 05:58

Mick Chew

Daily medicines
and specialist reviews

“

As a thyroid cancer survivor, I have to take medicines everyday and have regular specialist reviews with my doctor. The app helps me to keep track all these so I don't have to. It works great!

Ken Sim

Exercise routines
where I already work

“

I suffered from a leg muscle injury a couple of years back and I have to do regular exercises. The app is easy to use and lets me customise the right cycles and reminders. The integration into Claude is great, it prompts me directly in Claude to remind me to do my exercises

Seb Tan

A little peace of mind
while caring for Dad

“

My dad has a heart condition. I paired my CareBuddy with his Fitbit to keep track of his health metrics. It works great and it pings me every time there is an anomaly in his metrics. My dad is amazed and was wondering how I can know in real time his status without being next to him. It feels great to know that I got my dad covered despite my busy work schedule

Pilot evidence and success measures

Three personal accounts today. Proposed pilot: 100 circles over 12 weeks

Current evidence	Pilot measure	Proposed goal	Measurement
Mick Chew Daily medicines and specialist reviews	Activation	At least 80%	First routine and member invited within 7 days of enrolment
	Week-8 activity	At least 50%	One confirmed care action during the eighth usage week
Ken Sim Exercise routines and Claude reminders	Routine follow-through	Establish baseline	Completed due actions / due actions User-reported routine completion
	Caregiver engagement	Establish baseline	2 active authorised members in a circle, plus caregiver feedback
Seb Tan Caregiver visibility and Fitbit alerts	Willingness to pay	1 paid extension	A signed sponsor extension Test the S\$120 annual price
	Delivery cost	S\$3/month budget	Full delivery cost per funded circle AI, hosting and support included

Singapore TAM, SAM & SOM

Illustrative annual revenue potential at S\$120 per care circle

TAM · Total market

S\$178.8m

1.49m care circles

All resident households
Upper bound, before need or adoption

1.49m × S\$120 per year

SAM · Initial segment

S\$53.6m

447,000 care circles

Assumed 30% of households
Have a need and can use the service

1.49m × 30% × S\$120 per year

SOM · Year-3 scenario

S\$0.60m

5,000 funded care circles

Target through partner distribution
About 1.1% of modelled SAM

5 partners × 5,000 eligible circles
× 20% funded conversion
× S\$120 per year

Assumptions: one circle per household; S\$10/month; 30% SAM eligibility; partner reach and conversion are unvalidated.
TAM and SAM are potential revenue, not current spend. SOM is a target scenario, not a forecast.

CareBuddy’s differentiation

A shared care workflow with reminders in the tools people already use

Existing tool	Documented strengths	CareBuddy’s intended role
Medisafe	Medication management and caregiver reminders	Shared routine and appointment context with care reminders in an AI assistant
Google Health with Fitbit devices	Wearable health metrics and AI coaching with Premium	Family coordination and follow-through Connected device feeds are planned
Claude	Conversation and actions through connected tools	Scoped care context, validated changes and reminders through host scheduling

CareBuddy’s positioning centres on the family care workflow

SWOT analysis

Prototype strengths, production gaps and the conditions for adoption

Strengths

Working mobile care-circle prototype
Confirmable actions with scoped AI context
Clear routine and coordination use case

Weaknesses

Production identity and tenant storage pending
Retention and willingness to pay untested
Clinical and wearable integrations limited

Opportunities

Singapore’s ageing population
Caregiver pilots via community or clinical partners
Tencent Cloud and NTU collaboration potential

Threats

Trusted care platforms and existing reminder tools
Low repeat use or limited digital confidence
Trust failures and AI/provider cost dependence

Near-term priority Validate repeat use and a paying sponsor while closing identity and tenant-isolation gaps.

Business model and unit economics

Proposed sponsor funding, with an illustrative cost budget per funded care circle

S\$120

per care circle per year

Initial payer

An employer, insurer or pilot sponsor funds family access to a shared care plan.

Self-pay option to test

Families can fund their own circle.
Clinical consultation fees sit outside this plan.

S\$10 monthly revenue

Direct delivery budget per funded circle

Monthly cost budget	S\$
AI usage	0.75
Hosting, storage and jobs	0.75
Participant support	1.50
Total direct delivery	3.00

S\$7

Monthly contribution

70%

Contribution margin

Go-to-market strategy

Singapore caregiver pilots first; sponsor-funded distribution after validation

Months 0–3

Caregiver pilot

100 circles through one community or clinical partner

Daily routines and shared tasks
Guided onboarding and support

Gate: ≥80% activation in 7 days
≥50% active in usage week 8

Months 4–6

Paid cohort

Pilot sponsor, then employers with caregiver benefits

Annual sponsor plan: S\$120/circle
Test pricing and service levels

Gate: signed paid extension
Manageable cost per active circle

Months 7–12

Partner rollout

Employer or insurer distribution; regional partner discovery later

Repeatable onboarding and support
Expand integrations when needed

Gate: 2–3 paying partners
Repeatable retention and economics

Business model hypothesis: partners fund care circles; family access is included.
The timeline starts after production readiness. All milestones and pricing are proposed targets.

Tencent partnership opportunities

Production readiness and distribution for a Singapore care-coordination pilot.

Potential value to Tencent: a reference workload for cloud and AI services.

Initial ask

A technical workshop and a defined cloud/model support package.

01 Cloud architecture & pilot support

Review availability and data boundaries.
Request cloud support for a defined pilot budget, with a deployment and recovery review.

02 AI quality & cost

Compare models on caregiver tasks and language coverage. Track latency, cost and confirmed actions before increasing usage.

03 Commercial distribution

Explore Development Partner eligibility and introductions to suitable channels. Publish a reference case only with participant consent.

NTU partnership opportunities

Nanyang Technological University
Caregiver research and commercial validation.

Potential value: a platform for applied
ageing and implementation research.

Initial ask

A joint scoping session with an ageing
research lead and a venture adviser.

- 01 **ARISE: ageing & caregiver design**
Co-design with caregivers and older adults.
Evaluate ease of use and weekly engagement;
explore a fit with health-coaching work.

- 02 **LKCMedicine: evaluation design**
Seek Primary Care & Family Medicine input
on content and evaluation design. Measure
feasibility before testing clinical outcomes.

- 03 **NTUitive: commercial validation**
Explore venture-building advice, pricing
validation and partner introductions, subject
to programme eligibility and agreed IP terms.

WhiteCoat teleconsultation partnership

A proposed route from everyday care to professional medical advice

CareBuddy

Offers a teleconsultation route when a user seeks medical advice. Helps the user prepare for a conversation with a doctor.

WhiteCoat

Provides the consultation through its own clinical service. The doctor assesses suitability and determines clinical care.

CareBuddy follow-through

Helps organise the next routine using the doctor’s instructions. Any future data handoff needs explicit consent and agreement.

Partnership outlook

The team has high confidence in securing a WhiteCoat deal. Commercial terms and integration scope remain to be agreed.

Current demo

Opens a WhiteCoat GP link. Partner booking and data transfer are proposed next steps.

Joint pilot proposal

100 care circles · 12 weeks · Singapore

Weeks 1–2	Co-design, consent and onboarding
Weeks 3–10	Caregiver use with weekly feedback
Weeks 11–12	Evaluate use, cost and paid extension

Proposed success measures

80%	Activate within 7 days First routine + member invited
50%	Weekly active in usage week 8 At least one confirmed care action

Both measures use all enrolled circles as the denominator.

Tencent

Architecture and model review
Defined pilot support request

NTU

Co-design and feasibility study
Ethics/research oversight as needed

CareBuddy

Product, onboarding and support
Metering and incident response

Continue if repeat use and delivery cost support a funded next cohort.

Partner requests and the next 90 days

Proposed commitments for a 100-circle Singapore pilot, starting from partner kickoff

Tencent

One architecture and security review.
A 12-week cloud and TokenHub support package for the agreed pilot budget.

Potential value to the partner

A consented reference case with measured cloud usage and service costs.

NTU

One research lead for caregiver co-design and feasibility evaluation.
Help recruit under an agreed protocol.

Potential value to the partner

Caregiver usability and implementation findings, with agreed publication rights.

WhiteCoat

One service owner for the referral journey.
Agree referral, consent and booking scope.
Sign a pilot collaboration agreement.

Potential value to the partner

A proposed source of consultation referrals and a family follow-through workflow.

By day 30

Agree partner roles, budget and the evaluation protocol.

By day 60

Verify identity, consent and tenant access. Complete readiness review.

By day 90

Begin cohort onboarding when agreements and readiness gates are met.

Care Buddy architecture

Healthcare Track · Case Study 2: AI Healthier Every Day

Fictional care records. Live weather and validated AI actions in the prototype.

System architecture

The server owns care state and keeps AI credentials out of the browser

Prompt design and saved actions

Example: “Change my wind-down reminder to 9pm daily”

The model proposes

Records are untrusted data.
Missing fields need clarification.
Medication instructions stay fixed.
No arbitrary database write tool.
An informational reply cannot prove a save. The receipt comes from a committed transaction.

Assistant notification architecture

A personal plugin reads chosen profiles after the user enables host scheduling

Read care, acknowledge delivery

Selected profiles only. The exported token can be revoked.
Acknowledgement records delivery without changing care.
No repeated unchanged alert after successful delivery.
Installation alone does not start background checks.

Alerts use stored readings, including labelled demo data. Polling is not emergency monitoring.

Trust boundaries and trade-offs

The prototype separates generated language from authority to change care

Browser boundary

Browser namespace
View/manage checks

AI boundary

Untrusted record data
Validated tool calls

External boundary

Scoped export token
GP link handoff

Current prototype

No-login demo care spaces
SQLite on one server
Fixed sleep content
Seeded health readings

Design trade-off

Fast setup and review
Auditable saved actions
Separate deterministic alerts
No clinical outcome claim

Before patient use

Verified identity and consent
Real device integrations
Durable hosted scheduling
Clinical and user evaluation

Care Buddy supports everyday care organisation. Clinicians retain clinical decisions.

High availability architecture

Proposed Tencent Cloud deployment in Singapore

Targets to validate 99.9% core availability · restore ≤30 min · data loss ≤15 min

Regional disaster recovery needs a separate approved location and recovery plan.

Multi-tenancy

One platform; organisation boundaries and consent within each care circle

TENANT = ORGANISATION OR DIRECT FAMILY ACCOUNT

Access within a circle

The family owner grants view or edit rights.
Sponsor access follows explicit consent.

Isolation across tenants

Validate tenant and circle scope on every query, object path, job and AI request.

Operations at scale

Separate quotas, audit logs and billing.
Test denied access across tenant boundaries.

Enterprise option

Offer a dedicated database when contracts require stronger physical separation.

Security for production

Proposed controls for a dependable service handling personal care data

Encryption

TLS 1.2+ for data in transit.
AES-256 for databases, files and backups.
Manage and rotate keys through KMS.

Data segregation

Verify tenant and care-circle scope for records, files, jobs and AI context.
Separate production from demo and test data.

Access and secrets

Verified sign-in and minimum necessary access.
MFA for privileged operators.
Keep AI keys and credentials on the server.

Monitoring and recovery

Log access and changes without care content.
Rate-limit APIs and detect unusual activity.
Test encrypted restores and incident response.

Privacy and consent

Proposed controls give people a clear choice over their care information

Sharing by choice

Choose who can view or manage each circle.
Revoke sharing and assistant connections.
Keep sponsor reporting separate from records.

Minimal AI context

Send only authorised information needed for the task. Remove unnecessary identifiers.
Review provider retention and data-use terms.

Purpose and retention

Explain how care data supports the service.
Define retention and deletion rules.
Provide a process for access and correction.

External handoffs

Ask before sending data to teleconsult partners.
Assess storage and processing locations.
Agree breach handling and provider contracts.

CodeBuddy: frontend redesign

Detailed interface requirements and CodeBuddy’s implementation task list

lets redesign the frontend to make it more user friendly and intuitive.

change top header from white color to a warmer faint yellow color that is warmer

remove the care for <me> your care on the top

Keep the current day and date, add a running current time at the back

Change Your day title to the current weather, depicting with icon, temperature in celcius, humidity, PSI level

put a small note section at the bottom with Going to work? CareBuddy recommends bringing umbrella as there is a 28% chance of raining at CBD later today. An umbrella a day keeps the rain away!

remove the routines to record and appointment today line.

Keep the notification for morning medication. Change the text to Rise and Shine! A brand new day, a brand new you! remove the not recorded tag

Add another notification on reviewing your sleep

Sleep duratiion: 6 hours 37 mins

Raise AC temperature by 1 degrees tonight to get a better sleep~

Green button with magnify glass icon, text as Review Sleep. same faint yellow collow box for remind me later.

Your rem sleep is only around 1 hour, you are tossing and turning throughout your sleep which correlates to your lower body temperature during those times. CareBuddy suggest raising the AC temperature

Keep the next appointment section but same change color to faint yellow color

Change daily timeline section background to a different colour green so it shows as a different section, alternate down through other sections

CodeBuddy

✔ Task List 6/10 done

✔ Read current frontend files (App.tsx, components, CSS) to understand structure

✔ Redesign top header: faint yellow color, remove 'Care for Me' text, keep day/date with running live clock

✔ Replace 'Your day' title with current weather (icon, temp °C, humidity, PSI)

✔ Add rain recommendation note section at bottom (umbrella advice)

✔ Remove routines to record and appointment today lines

✔ Update morning medication notification text, remove 'not recorded' tag

○ Add sleep review notification with green Review Sleep button and faint yellow remind-later box

ANNEX E · Historical UI iteration and development-tool usage

48

CodeBuddy: backend onboarding

Source-file reading and a plan for onboarding and family state

CodeBuddy: brand and typography

The supplied palette and CodeBuddy’s completed font and colour task list

See it for yourself.

01 **CareBuddy product & brand** ↗
